

Identity Management

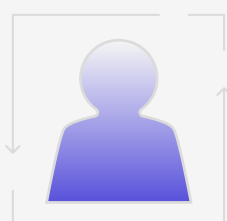

Strengthen security, ensure compliance, and simplify identity management.

Without centralized identity governance, organizations face privilege creep, inconsistent access controls, and compliance gaps that put security and efficiency at risk.

Netwrix Identity Management helps organizations identify, manage, and govern identities across hybrid environments. Automating provisioning, group and password management, and enforcing role-based access control (RBAC) reduces IT workload and security risks.

With full visibility into identities and access, organizations can prevent privilege creep, enforce least privilege, and streamline audits — improving security and operational efficiency.

Automated governance and compliance

Automate user lifecycle management, access certification, and policy enforcement to reduce risks and pass audits faster.

Enhanced security and least privilege enforcement

Eliminate over-provisioned accounts and control access through precise group management.

Operational efficiency and self-service

Reduce IT workload with self-service access requests, delegation, automated workflows, and self-service password resets.

The product is very easy to scale from small integrations to company wide deployment. Extra modules and functionalities are constantly in development and can be easily added to an existing solution.”

What’s included

[Netwrix Identity Manager ↗](#)

[Netwrix Directory Manager ↗](#)

[Netwrix Password Policy Enforcer ↗](#)

Safeguard your identities

Identity lifecycle management	Automate onboarding and offboarding with policy-based workflows from provisioning to de-provisioning. Enable RBAC to reduce errors and manual effort while ensuring the right access at the right time.
Group lifecycle management	Reduce manual workflows by automating group creation, membership updates, and access control to maintain structure and prevent unnecessary access accumulation.
Entitlement management	Manage and control access entitlements based on roles and responsibilities to reduce the risk of unauthorized access, boost security, and improve compliance.
Support for access requests	Automate and delegate access requests to cut administrative effort, reduce errors, and save costs.
Access certification (attestation)	Regularly review and certify access rights to reduce excessive permissions and meet regulatory requirements.
Risk management	Continuously detect and address identity risks, including SoD violations, dormant accounts, and excessive entitlements, with built-in risk scoring and controls.
Password policy enforcement	Enforce strong password policies, prevent reuse, and block compromised credentials to reduce credential-based attack risks and ensure compliance.
Auditing and reporting	Track all identity and access changes with comprehensive auditing and reporting. Generate detailed records to streamline audits and meet compliance requirements.

Why Netwrix?

Faster deployment and lower TCO

Out-of-the-box governance and automation reduce time-to-value and implementation costs.

Flexible deployment options

Broad integration capabilities support hybrid environments and evolving business needs.

Comprehensive governance without complexity

Simplify identity governance across distributed teams and hybrid environments. Netwrix adapts to your organization — not the other way around.
